

Figure 2b: Sarcoidosis T cells and monocytes display interferon signatures. Cumulative density distributions of expression of interferon genes relative to controls are shown for each cell type. Vertical dashed lines indicate points where interferon gene expression in sarcoidosis and control cells are equivalent; horizontal dashed lines indicate the cumulative density at which sarcoidosis cells express more interferon genes relative to controls. Color indicates direction of distribution shift (blue and red indicate the majority of sarcoidosis cells underexpress or overexpress interferon-associated genes relative to controls, respectively)
